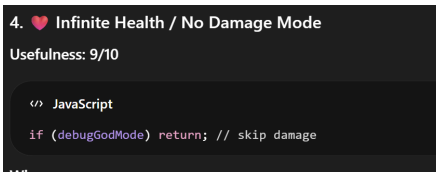
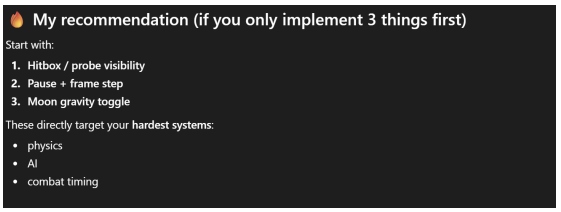
Process & Decision Documentation

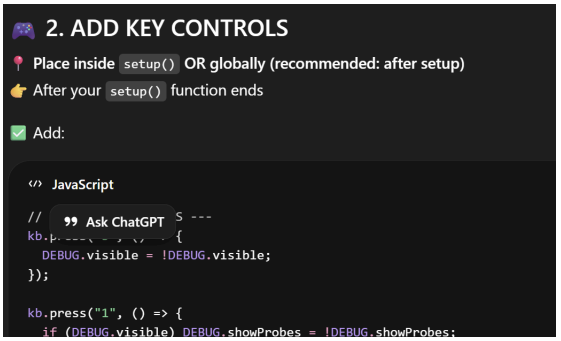
Side Quest #7 Decisions

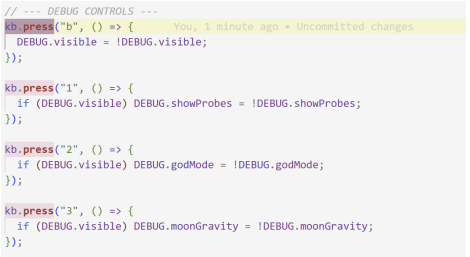
I tried to continue the conversation from my previous chat in ChatGPT from SQ6, but my memories were reaching the limit, so I had to copy and paste its response and my code onto a new one.

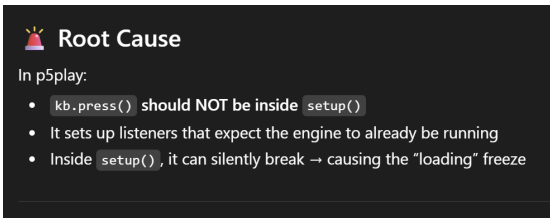




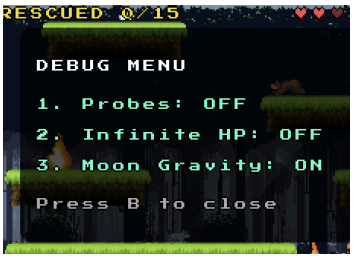
ChatGPT suggested other features ranked higher than the one I chose (infinite health), and I chose to ignore them because I felt the Infinite Health mode could save a lot of hassle than accidentally dying over and over to test level, enemy, and fire spawn, and win condition, rather than relying on restarting or dying each time.

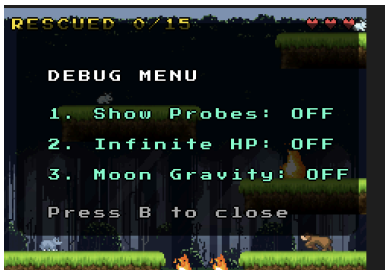






This part really confused me, because it was the one that suggested to me to place it inside the setup() OR after it. When I prompt it to find the issue, it suddenly points out the issue. While looking over my code, I noticed how the inputs of kb.presses were inside draw(), but ChatGPT did not suggest that initially.





Finally, it showed on screen, and then I adjusted the words and size of the rectangle to fit better.

GenAI Documentation
Date Used: March 23, 2026

Tool Disclosure: ChatGPT 5.2

Purpose of Use: Using GenAI to help aid in coding for sidequest 7

Summary of Interaction: I used ChatGPT to generate the debug menu and also had it debug its own code it provided for me.

Human Decision Point(s): Took charge of defining specific variables of the codes and what aspect of Chat decisions and interpretation of my prompt. ChatGPT gave me options and suggestion and I choose to ignore some because I liked some ideas or think it works better in the context of the game.

Integrity & Verification Note: I ran the code in VS-Code and double-checked on Live Server to see if the output was working and debu. I also took screenshots of my progress and the result of what I got from some of the coding.

Scope of GenAI Use: GenAI is used primarily as a coding tool for this project, with human input.

Limitations or Misfires: ChatGPT gave me some contradicting suggestions (e.g putting my inputs in setup/after and afterwards says its incorrect) unless I point out the problem, then it addresses it.

Summary of Process (Human + Tool):

- First prompt was asking GenAI to suggest debug feature and to rate them on a scale of usefulness
- Selected the ones I like and asked it to provide the codes
- Test in VSCode and edit if needed
- Run the code and additional prompt again to debug issues

Verification & Judgement

- For each ideas, I individually tested them in VSCode to validate if they would work with the current code without much-needed edits
